

Suunto KB-14 compasses

Suunto bearing compasses are designed to combine extreme accuracy with ease and speed of operation. The accuracy is $1/3^\circ$, graduation $1/2^\circ$ and the compass weighs only 115 g. The flat, compact housing is designed to stand up to heavy-duty wear. The compass is water resistant.

The KB-14 hand-bearing compass is an excellent tool for foresters, surveyors, geologists and many others. Suunto bearing compasses are designed to combine extreme accuracy with ease and speed of operation.

The cards of these compasses are immersed in a special dampening fluid that ensures vibrationless, smooth movement. They are pivoted on polished sapphire tips. The veering assembly is to all intents and purposes subject to no wear and the liquid remains clear and its viscosity low under all conditions.

The compasses have been given permanent anti-static treatment. The lens apertures of the Suunto KB-14 is restricted horizontally by a column, which automatically centres the eye on the optical axis, thus eliminating parallax.

There is also a rubber cover accessory for the Suunto KB-14 that is made of a saltwater and UV-resistant mixture of EPDM and natural rubber.

Product Features

Accuracy $1/3^\circ$

Graduation interval 0.5°

0° and 360° scale - 0

Anodised light-alloy housing - protects against impact, corrosion and water

Individually calibrated

Optical adjustment

Liquid Dampened

Sapphire Jewel bearing

Includes Nylon pouch with belt-loop and lanyard

Available for 5 geographic balancing zones
